Where do you stand?
AI allowed <----------> AI not allowed

1

Writing Texts
(drafting, writing, entire paragraphs)

What do we want?

Competence: University

Image Generation
(Creating Graphics)

Yes, but it's not necessary; it doesn't add any value.
-> Raise awareness of what makes sense

Read / Summarize Texts
Analyze Papers Using AI

Competence: University

Where do you stand?
AI allowed <----------> AI not allowed

1

Study Planning
(Study Design, Research Questions, Data Analysis, ...

Feedback Is Difficult

Study Guide
(Exam Questions, Study Summary)

Summarize it yourself, ftw

Literature Review
Finding and Categorizing Sources

Where do you stand?
AI allowed <----------> AI not allowed

1

Programming
(Writing Code / Coding)

half points

half points

depending on the course/semester

Brainstorming / Sparring Partner
(Developing Ideas)

should not replace people

The best use of AI by students that I've come across so far...

2

- **Formatting and Grammar in Texts**
- **Linguistic Revision of an EU Project Paper**
- **Generate boilerplate code in large SE projects (+ reporting tools)**
- **AI-Chair**
- **better homework assignments, by modern standards, "more" was done/achieved (code scripting, ?)**
- **An optional extension in addition to the actual contribution, which goes well beyond the required level.**
- **Project presentation following a brief group activity (photos, design)**

In my classes, I prohibit the use of AI...

2

- **Vibe Coding in HME**
- **Complete AI Solutions**
- Applying New Learning Content
- **direct "conflict" with learning objectives**
- Exam
- **where the original contribution is no longer recognizable (e.g., generating interview guides from individual questions)**
- **Writing Texts**
- Writing papers and publicly accessible texts
- Everything Freshmen Do
- No explicit prohibition, except for "complete" / "substantial" text generation

To that end, I strongly encourage my students to use AI ...

2

- **Creating Personas**
- **Agentic Coding + Best Practices in the Master's Program (ASE Exercise)**
- **Grammar & Spelling Tools**
- **Vibe Coding for Quick Testing**
- Deep Research
- **Checking Your Own Solutions**
- Checking for Grammatical Inconsistencies in the Paper
- **Text Revision: Consistency, Narrative Flow**
- Beautiful Latex Tables
- **Try everything, especially using different models and comparing them; learn better AI techniques**
- Further research and shell syntax for debugging DevOps issues (+ log analysis)
- not at all

I'm not sure whether AI should be allowed or not...

2

- **Auto-Complete for the Current Line of Code in the 1st and 2nd Semesters**
- **Formulating the Research Question (-> not "Finding" it!)**
- **Creating Entire Text Passages (Paragraphs)**
- **In earlier vs. later semesters -> when and to what extent?**
- Where is the line drawn? When educational goals are no longer being met?
- Summarizing Papers

The worst example of students' use of AI that I've come across so far (AI Slop)

2

(? Gender asterisk now in italics -> copied in as is + submitted (as specified))

- **(? pathetic) inappropriate AI slob**
- Send me a brief summary of your bachelor's thesis topic -> Multi-page PDF with AI template
- **Related Work: Text block after text block without transition**
- **Generated Final Presentation**
- #You can enter the text color of your choice here
- **Studi has an LLM generate code that can't possibly work; 2 people waste 1 hour debugging it**
- Gemini Logo in an Image Editing Exercise
- AI Images on Slides & in Apps
- Code cannot be explained
- AI images on presentation slides in OS
- Wasted time debugging. Code is unnecessarily complex.
- Fictional literature
- +1
- I just posted the question from the worksheet in Chatty and submitted my answer
- A poor overview of my own master's thesis in terms of content and design

Why do I want clear, consistent guidelines at the department?

3

Guidelines for final theses

- **(From) when does it count as plagiarism?**
- **Text and Code Generation**
- **Labeling**
- + Difference from courses
- final theses
  +1 +1
- What do we recommend, allow, and prohibit in the BA/MA program?
- **How thoroughly do we investigate and penalize unauthorized use?**
- How should we deal with students who don't want to use AI? Fairness?
- "Intervention Plan"
  What to do in the event of (possible) rule violations?
  +1
- Allow MA vibe coding
- Action to be taken if unauthorized use is detected:
  - Point deduction
  - Failure
  - Retake
  - etc.
- all of which cannot be verified during their creation (? Breschlion processes) theses, documentation, project work, code, ...)
- Make it clear to people that they're only hurting themselves if they don't learn this stuff properly! Personal responsibility! In the long run, monitoring isn't realistic anyway

Where do I sense a tension between general rules and course-specific rules?

3

Practical Courses vs. Research Courses

- **Different rules may be necessary depending on the semester**
- ... not just by semester, but probably based on individual prior knowledge or skills
- **Agentic Coding + Best Practices in the Master's Program (ASE Exercise)**
- Freshmen vs. "Upperclassmen" Bachelor's vs. Master's
- What are the learning objectives?
- Actually, everywhere... In my opinion, it doesn't make sense to be consistent across the board
- **Which rules take precedence/carry more weight?**
- What skills should universities teach?
- vs. individual courses
  vs. for industry?

What Should Be Included in Good Documentation of AI Use—Which Aspects, and in What Form?

3

- Tools/Apps Used
- Examples of Use
- Terms of Use

- **Not a thousand links to polished chats**
- **Paid Vibe Coding subscription?**
- - Models
  - Scope
- **Revise <-> Correct <-> Generate <-> Rephrase**
  -> from text
- **A "best practice" for labeling different AI use cases (code is likely different from text, etc.)**
- Legal guidelines for uploading files to GPT, etc. -> Informing students
- "Own contribution" percentage is immediately apparent
- **Concise, structured overview: which tools are used for what, plus very detailed documentation of particularly important prompts**
- Generally allow work without documentation, but require more challenging assignments and possibly oral exams (for programming courses)
- Not just a general "disclaimer" -> specific

Off-Topic "Parking Lot"

- **What comes after the current Agents?**
- **Will streaming services get more expensive? -> Not all students can afford subscriptions**
- **Conflict Between Rule-Setting and Verifiability**
- What's good for us as a group
- **AI Everything is man-made**
- How Can Students Experience Self-Efficacy Despite AI?
